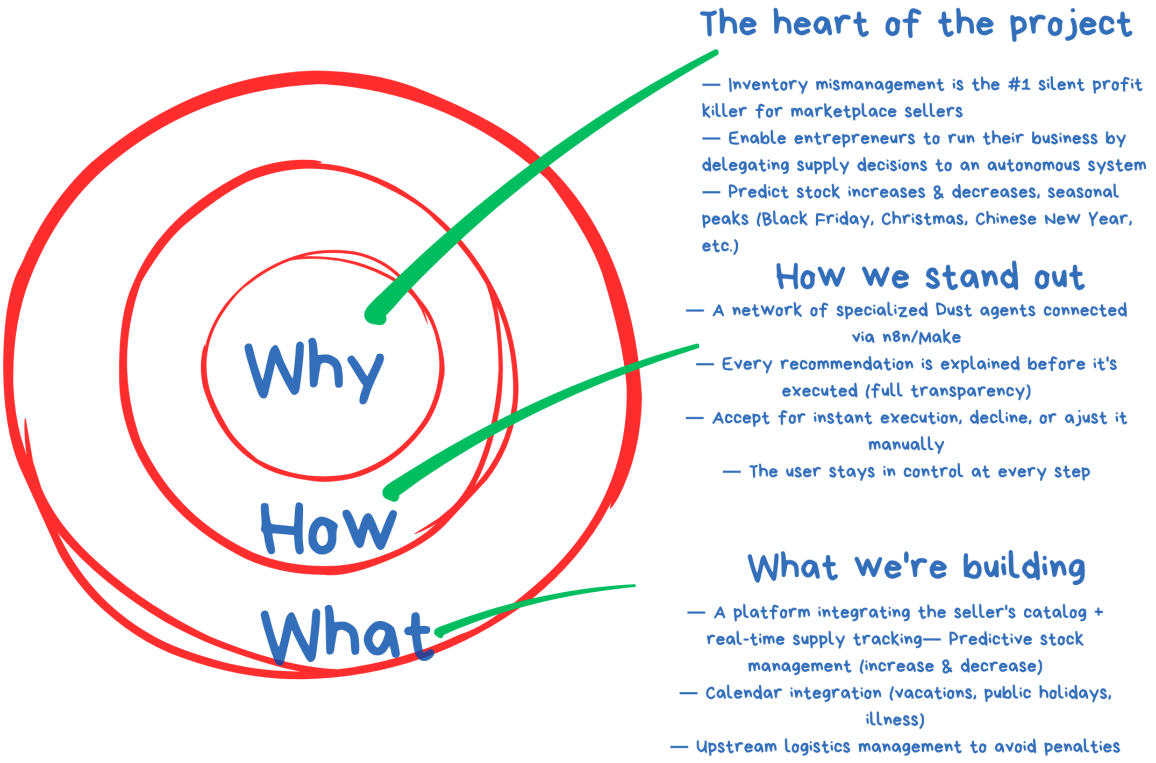
Golden Circle



The Ambition

The goal of this project is to fundamentally change the role of a marketplace seller. Today, a solo entrepreneur on Mirakl is essentially a manual operator: they monitor stock levels, anticipate demand, adjust pricing, manage supplier lead times, and react to platform alerts — all by themselves, all the time. The infrastructure of Mirakl Connect is powerful, but decision-making remains entirely human, which means it is slow, fragmented, and exhausting at scale.

Our project introduces a different model. Rather than giving the seller another tool to manage, we give them a system that manages on their behalf. We call it the Supply OS — an operating system for inventory intelligence, built on top of Mirakl Connect, that observes, reasons, decides and acts in a continuous loop.

The Technical Foundation

The project is built on the coupling of complementary technologies that each play a distinct role.
Dust is the cognitive layer. It ingests the seller's catalog data, sales history, and business rules, and uses that context to produce reasoned decisions — not just pattern matching, but genuine logical inference. When Dust recommends a restock, it can explain why: declining sales velocity, an upcoming seasonal peak, a supplier lead time that requires acting now. The seller always knows the reasoning behind every action.

n8n is the execution layer. Once a decision is made, n8n connects directly to the Mirakl Connect API and carries it out — updating stock quantities, modifying store statuses, sending alerts, triggering supplier orders. It is the bridge between intelligence and action, operating in real time without human intervention.
Together, they form a closed loop: Dust thinks, n8n acts, and the results feed back into the next cycle of analysis.

What Makes It Different

Most inventory tools are reactive. They show you what happened and wait for you to respond. The Supply OS is proactive — it identifies what is about to happen and moves before the problem occurs.

Reputation Arbitration is one of the clearest illustrations of this. When stock runs critically low across multiple sales channels, a human seller typically handles it on a first-come, first-served basis. The agent operates differently. It evaluates the strategic value of each channel — margin, volume, badge status — and reallocates stock accordingly. It can decide to pause sales on a low-margin marketplace in order to reserve the remaining units for a channel where the seller holds a Top Seller badge. The short-term revenue loss is calculated and accepted in order to protect a reputation that took months to build. No human makes that trade-off in real time. The agent does it automatically.

The Smart Calendar follows the same logic, but applied to the human dimension of the business. A solo entrepreneur is not a machine — they go on

vacation, get sick, take public holidays. The agent accounts for this. Connected to the seller's calendar, it uses that information operationally: if a seller is leaving for two weeks, the agent anticipates the stock surge that will occur during their absence, adjusts safety stock levels in advance, and activates Vacation Mode on Mirakl at the right moment to avoid penalties. If an unexpected absence occurs, the system adapts in real time. The business keeps running correctly even when the person running it cannot be present.
Control Stays With the Seller

Autonomy does not mean opacity. Every decision the agent makes is explained before it is executed — the seller sees what action is being recommended, why it is being recommended, and what outcome it is expected to produce.

The seller also defines their own level of delegation. In Recommendation mode, the agent surfaces suggestions and the human acts. In Semi-auto mode, the agent prepares the action and the seller approves it with a single confirmation. In Full Autonomous mode, the agent executes and the seller receives a summary after the fact. These modes can be adjusted per scenario — a seller might want full autonomy on routine restocking but manual approval on any decision that touches their premium channel.

Why This Matters for Mirakl

This project adds the missing intelligence layer on top of Mirakl Connect.

It transforms an execution platform into a decision-making system by enabling agents to analyze, decide, and act on behalf of the seller.

With this Supply Operating System, a solo seller can manage inventory and supply with the performance of a full operations team.
